# Binary Positional System (Base 2 or radix 2)

## Example

### Decimal Example

$$\begin{aligned} 346.17_{10} &= (3 \times 10^2) + (4 \times 10^1) + (6 \times 10^0) + (1 \times 10^{-1}) + (7 \times 10^{-2}) \\ &= 300 \quad + 40 \quad + 6 \quad + 0.1 \quad + 0.07 \end{aligned}$$

### Binary Example

$$\begin{aligned} 1101.01_2 &= 1 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0 + 0 \times 2^{-1} + 1 \times 2^{-2} \\ &= 8 \quad + 4 \quad + 0 \quad + 1 \quad + 0 \quad + .25 \\ &= 13.25_{10} \end{aligned}$$

- **Diminished Radix Complement**

Number N in base r having n digits

$$(r-1)\text{'s complement} = (r^n - 1) - N$$

- **Radix Complement**

Number N in base r having n digits

$$(r)\text{'s complement} = (r^n - N)$$

**Ex: base 2:**            2's complement,    1's complement

**base10:**        10's compliment,    9's compliment

Some possible binary codes are illustrated below.

| Decimal<br>digits | BCD<br>(8421) | Excess-3 | 84-2-1 | 2421 | Bi-quinary<br>(5043210) |
|-------------------|---------------|----------|--------|------|-------------------------|
| 0                 | 0000          | 0011     | 0000   | 0000 | 0100001                 |
| 1                 | 0001          | 0100     | 0111   | 0001 | 0100010                 |
| 2                 | 0010          | 0101     | 0110   | 0010 | 0100100                 |
| 3                 | 0011          | 0110     | 0101   | 0011 | 0101000                 |
| 4                 | 0100          | 0111     | 0100   | 0100 | 0110000                 |
| 5                 | 0101          | 1000     | 1011   | 1011 | 1000001                 |
| 6                 | 0110          | 1001     | 1010   | 1100 | 1000010                 |
| 7                 | 0111          | 1010     | 1001   | 1101 | 1000100                 |

| 9                 | 1001          | 1100     | 1111   | 1111 | 1010000                 |

## The Reflected Code

The advantage of the reflected code over pure binary numbers is that a number in the reflected code changes by only one bit as it proceeds from one number to the next. The reflected code is also known as the *Gray* code.

## Generation of Gray Codes:

an n-bits code is generated by reflecting the (n-1)-bit code.

| Reflected Code | Decimal Equivalent |
|----------------|--------------------|
| 0000           | 0                  |
| 0001           | 1                  |
| 0011           | 2                  |
| 0010           | 2                  |
| 0110           | 4                  |
| 0111           | 5                  |
| 0101           | 6                  |
| 0100           | 7                  |
| 1100           | 8                  |
| 1101           | 9                  |
| 1111           | 10                 |
| 1110           | 11                 |
| 1010           | 12                 |
| 1011           | 13                 |
| 1001           | 14                 |
| 1000           | 15                 |

Four-bit reflected code

- Boolean expressions must be evaluated with the following order of operator precedence

- parentheses
- NOT
- AND
- OR

Example:

$$F = (A(\overline{C + \overline{B}D}) + \overline{B}\overline{C})\overline{E}$$

$$F = \underbrace{\left( \underbrace{A \left( \underbrace{C + \underbrace{\overline{B}D}_{\text{AND}} \right)}_{\text{OR}} + \underbrace{\overline{B}\overline{C}}_{\text{AND}} \right)}_{\text{OR}} \underbrace{\overline{E}}_{\text{NOT}}$$

$$X + 0 = X$$

$$X + 1 = 1$$

$$X + X = X$$

$$X + X' = 1$$

$$(X')' = X$$

$$X + Y = Y + X$$

$$X + (Y + Z) = (X + Y) + Z$$

$$X(Y + Z) = XY + XZ$$

$$X + XY = X$$

$$X + X'Y = X + Y$$

$$(X + Y)' = X'Y'$$

$$XY + X'Z + YZ \\ = XY + X'Z$$

$$X \cdot 1 = X$$

$$X \cdot 0 = 0$$

$$X \cdot X = X$$

$$X \cdot X' = 0$$

$$XY = YX$$

$$X(YZ) = (XY)Z$$

$$X + YZ = (X + Y)(X + Z)$$

$$X(X + Y) = X$$

$$X(X' + Y) = XY$$

$$(XY)' = X' + Y'$$

$$(X + Y)(X' + Z)(Y + Z) \\ = (X + Y)(X' + Z)$$

Consensus Theorem

- Example: Simplify the following expression

$$\mathbf{F = BC + B\overline{C} + BA}$$

- Simplification

$$\mathbf{F = B(C + \overline{C}) + BA}$$

$$\mathbf{F = B \cdot 1 + BA}$$

$$\mathbf{F = B(1 + A)}$$

$$\mathbf{F = B}$$

- Example: Simplify the following expression

$$F = A + \bar{A}B + \bar{A}\bar{B}C + \bar{A}\bar{B}\bar{C}D + \bar{A}\bar{B}\bar{C}\bar{D}E$$

- Example: Simplify the following expression

$$F = A + \bar{A}B + \bar{A}\bar{B}C + \bar{A}\bar{B}\bar{C}D + \bar{A}\bar{B}\bar{C}\bar{D}E$$

- Simplification

$$F = A + \bar{A}(B + \bar{B}C + \bar{B}\bar{C}D + \bar{B}\bar{C}\bar{D}E)$$

$$F = A + B + \bar{B}C + \bar{B}\bar{C}D + \bar{B}\bar{C}\bar{D}E$$

$$F = A + B + \bar{B}(C + \bar{C}D + \bar{C}\bar{D}E)$$

$$F = A + B + C + \bar{C}D + \bar{C}\bar{D}E$$

$$F = A + B + C + \bar{C}(D + \bar{D}E)$$

$$F = A + B + C + D + \bar{D}E$$

$$F = A + B + C + D + E$$

## Complementing a truth table

- The complement of a function should output 0 when the original function outputs 1, and vice versa.
- In a truth table, we can just exchange 0 and 1 in the output column.
  - On the left is a truth table for  $f(x,y,z) = (x + y')z + x'$ .
  - On the right is the table for the complement of  $f$ , denoted  $f'(x,y,z)$ .

| x | y | z | $f(x,y,z)$ |
|---|---|---|------------|
| 0 | 0 | 0 | 1          |
| 0 | 0 | 1 | 1          |
| 0 | 1 | 0 | 1          |
| 0 | 1 | 1 | 1          |
| 1 | 0 | 0 | 0          |
| 1 | 0 | 1 | 1          |
| 1 | 1 | 0 | 0          |
| 1 | 1 | 1 | 1          |

| x | y | z | $f'(x,y,z)$ |
|---|---|---|-------------|
| 0 | 0 | 0 | 0           |
| 0 | 0 | 1 | 0           |
| 0 | 1 | 0 | 0           |
| 0 | 1 | 1 | 0           |
| 1 | 0 | 0 | 1           |
| 1 | 0 | 1 | 0           |
| 1 | 1 | 0 | 1           |
| 1 | 1 | 1 | 0           |

## Complementing an expression

---

- To complement an expression, you can use DeMorgan's Laws to keep “pushing” the NOT operator inwards, all the way to the literals.

$$f(x,y,z) = (x + y')z + x'$$

$$\begin{aligned} f'(x,y,z) &= ((x + y')z + x')' && \text{[ complementing both sides ]} \\ &= ((x + y')z)' \cdot (x')' && \text{[ because } (x + y)' = x'y' \text{ ]} \\ &= ((x + y')' + z') \cdot x && \text{[ } (xy)' = x' + y', \text{ and } (x')' = x \text{ ]} \\ &= (x'y + z') \cdot x && \text{[ } (x + y)' = x'y' \text{ again ]} \end{aligned}$$

- Another clever method of complementing an expression is to take the dual of the expression, and then complement each literal.
  - The dual of  $(x + y')z + x'$  is  $(xy' + z) \cdot x'$ .
  - Complementing each literal yields  $(x'y + z') \cdot x$ .
  - So  $f'(x,y,z) = (x'y + z') \cdot x$ .

- **Complement of a Function.**

$$F = x'yz' + x'y'z$$

- **Complement of a Function.**

$$F = x'yz' + x'y'z$$

**dual of F is  $(x'+y+z')(x'+y'+z)$**

**complement each literal**

$$\text{- } (x+y'+z)(x+y+z') = F'$$

## Sum of products expressions

---

- There are many equivalent ways to write a function, but some forms turn out to be more useful than others.
- A **sum of products** or **SOP** expression consists of:
  - One or more terms *summed* (OR'ed) together.
  - Each of those terms is a *product of literals*.

$$f(x, y, z) = y' + x'yz' + xz$$

## Sum of products expressions

- There are many equivalent ways to write a function, but some forms turn out to be more useful than others.
- A **sum of products** or **SOP** expression consists of:
  - One or more terms *summed* (OR'ed) together.
  - Each of those terms is a *product of literals*.

$$f(x, y, z) = y' + x'yz' + xz$$

- Sum of products expressions can be implemented with **two-level circuits**.

## Minterms

---

- A **minterm** is a special product of literals, in which each input variable appears exactly once.
- A function with  $n$  input variables has  $2^n$  possible minterms.

## Minterms

- A **minterm** is a special product of literals, in which each input variable appears exactly once.
- A function with  $n$  input variables has  $2^n$  possible minterms.
- For instance, a three-variable function  $f(x,y,z)$  has 8 possible minterms:

$$\begin{array}{cccc}
 x'y'z' & x'y'z & x'y z' & x'y z \\
 x y'z' & x y'z & x y z' & x y z
 \end{array}$$

- Each minterm is true for exactly one combination of inputs.

| Minterm  | True when   | Shorthand |
|----------|-------------|-----------|
| $x'y'z'$ | $xyz = 000$ | $m_0$     |
| $x'y'z$  | $xyz = 001$ | $m_1$     |
| $x'y z'$ | $xyz = 010$ | $m_2$     |
| $x'y z$  | $xyz = 011$ | $m_3$     |
| $x y'z'$ | $xyz = 100$ | $m_4$     |
| $x y'z$  | $xyz = 101$ | $m_5$     |
| $x y z'$ | $xyz = 110$ | $m_6$     |
| $x y z$  | $xyz = 111$ | $m_7$     |

## Sum of minterms expressions

---

- A **sum of minterms** is a special kind of sum of products.
- Every function can be written as a *unique* sum of minterms expression.
- A truth table for a function can be rewritten as a sum of minterms just by finding the table rows where the function output is 1.

## Sum of minterms expressions

- A **sum of minterms** is a special kind of sum of products.
- Every function can be written as a *unique* sum of minterms expression.
- A truth table for a function can be rewritten as a sum of minterms just by finding the table rows where the function output is 1.

| x | y | z | $C(x,y,z)$ | $C'(x,y,z)$ |
|---|---|---|------------|-------------|
| 0 | 0 | 0 | 0          | 1           |
| 0 | 0 | 1 | 0          | 1           |
| 0 | 1 | 0 | 0          | 1           |
| 0 | 1 | 1 | 1          | 0           |
| 1 | 0 | 0 | 0          | 1           |
| 1 | 0 | 1 | 1          | 0           |
| 1 | 1 | 0 | 1          | 0           |
| 1 | 1 | 1 | 1          | 0           |

$$\begin{aligned}C &= x'yz + xy'z + xyz' + xyz \\&= m_3 + m_5 + m_6 + m_7 \\&= \Sigma m(3,5,6,7)\end{aligned}$$

$$\begin{aligned}C' &= x'y'z' + x'y'z + x'yz' + xy'z' \\&= m_0 + m_1 + m_2 + m_4 \\&= \Sigma m(0,1,2,4)\end{aligned}$$

$C'$  contains all the minterms *not* in  $C$ ,  
and vice versa.

## Product of sums expressions

- As you might expect, we can work with the duals of these ideas too.
- A **product of sums** or **POS** consists of:
  - One or more terms *multiplied* (AND'ed) together.
  - Each of those terms is a *sum of literals*.

$$g(x, y, z) = y'(x' + y + z')(x + z)$$

- Products of sums can also be implemented with **two-level circuits**.

# Maxterms

- A **maxterm** is a *sum* of literals where each input variable appears once.
- A function with  $n$  input variables has  $2^n$  possible maxterms.
- For instance, a function with three variables  $x$ ,  $y$  and  $z$  has 8 possible maxterms:

$$\begin{array}{cccc} x + y + z & x + y + z' & x + y' + z & x + y' + z' \\ x' + y + z & x' + y + z' & x' + y' + z & x' + y' + z' \end{array}$$

- Each maxterm is *false* for exactly one combination of inputs.

| Maxterm        | False when  | Shorthand |
|----------------|-------------|-----------|
| $x + y + z$    | $xyz = 000$ | $M_0$     |
| $x + y + z'$   | $xyz = 001$ | $M_1$     |
| $x + y' + z$   | $xyz = 010$ | $M_2$     |
| $x + y' + z'$  | $xyz = 011$ | $M_3$     |
| $x' + y + z$   | $xyz = 100$ | $M_4$     |
| $x' + y + z'$  | $xyz = 101$ | $M_5$     |
| $x' + y' + z$  | $xyz = 110$ | $M_6$     |
| $x' + y' + z'$ | $xyz = 111$ | $M_7$     |

# Product of maxterms expressions

- Every function can also be written as a unique **product of maxterms**.
- A truth table for a function can be rewritten as a product of maxterms just by finding the table rows where the function output is 0.

| x | y | z | $C(x,y,z)$ | $C'(x,y,z)$ |
|---|---|---|------------|-------------|
| 0 | 0 | 0 | 0          | 1           |
| 0 | 0 | 1 | 0          | 1           |
| 0 | 1 | 0 | 0          | 1           |
| 0 | 1 | 1 | 1          | 0           |
| 1 | 0 | 0 | 0          | 1           |
| 1 | 0 | 1 | 1          | 0           |
| 1 | 1 | 0 | 1          | 0           |
| 1 | 1 | 1 | 1          | 0           |

$$\begin{aligned}C &= (x + y + z)(x + y + z') \\&\quad (x + y' + z)(x' + y + z) \\&= M_0 M_1 M_2 M_4 \\&= \prod M(0,1,2,4)\end{aligned}$$

$$\begin{aligned}C' &= (x + y' + z')(x' + y + z') \\&\quad (x' + y' + z)(x' + y' + z') \\&= M_3 M_5 M_6 M_7 \\&= \prod M(3,5,6,7)\end{aligned}$$

$C'$  contains all the maxterms *not* in  $C$ , and vice versa.

- Now we've seen two different ways to write the function  $C$ , as a sum of minterms  $\Sigma m(3,5,6,7)$  and as a product of maxterms  $\Pi M(0,1,2,4)$ .
- Notice the product term includes maxterm numbers whose corresponding minterms do not appear in the sum expression.

| x | y | z | $C(x,y,z)$ |
|---|---|---|------------|
| 0 | 0 | 0 | 0          |
| 0 | 0 | 1 | 0          |
| 0 | 1 | 0 | 0          |
| 0 | 1 | 1 | 1          |
| 1 | 0 | 0 | 0          |
| 1 | 0 | 1 | 1          |
| 1 | 1 | 0 | 1          |
| 1 | 1 | 1 | 1          |

$$\begin{aligned}
 C &= x'yz + xy'z + xyz' + xyz \\
 &= m_3 + m_5 + m_6 + m_7 \\
 &= \Sigma m(3,5,6,7)
 \end{aligned}$$

$$\begin{aligned}
 C &= (x + y + z)(x + y + z') \\
 &\quad (x + y' + z)(x' + y + z) \\
 &= M_0 M_1 M_2 M_4 \\
 &= \Pi M(0,1,2,4)
 \end{aligned}$$

## The relationship

- Every minterm  $m_i$  is the *complement* of its corresponding maxterm  $M_i$ .

| Minterm              | True when   |
|----------------------|-------------|
| $(m_0) \quad x'y'z'$ | $xyz = 000$ |
| $(m_1) \quad x'y'z$  | $xyz = 001$ |
| $(m_2) \quad x'y z'$ | $xyz = 010$ |
| $(m_3) \quad x'y z$  | $xyz = 011$ |
| $(m_4) \quad x y'z'$ | $xyz = 100$ |
| $(m_5) \quad x y'z$  | $xyz = 101$ |
| $(m_6) \quad x y z'$ | $xyz = 110$ |
| $(m_7) \quad x y z$  | $xyz = 111$ |

| Maxterm                    | False when  |
|----------------------------|-------------|
| $(M_0) \quad x + y + z$    | $xyz = 000$ |
| $(M_1) \quad x + y + z'$   | $xyz = 001$ |
| $(M_2) \quad x + y' + z$   | $xyz = 010$ |
| $(M_3) \quad x + y' + z'$  | $xyz = 011$ |
| $(M_4) \quad x' + y + z$   | $xyz = 100$ |
| $(M_5) \quad x' + y + z'$  | $xyz = 101$ |
| $(M_6) \quad x' + y' + z$  | $xyz = 110$ |
| $(M_7) \quad x' + y' + z'$ | $xyz = 111$ |

- For example,  $m_4' = M_4$  because  $(xy'z')' = x' + y + z$ .

## Converting between standard forms

---

- We can convert sums of minterms to products of maxterms algebraically.

$$C = \Sigma m(3,5,6,7)$$

$$\begin{aligned} C' &= \Sigma m(0,1,2,4) && [ C' \text{ contains the minterms not in } C ] \\ &= m_0 + m_1 + m_2 + m_4 \end{aligned}$$

$$(C')' = (m_0 + m_1 + m_2 + m_4)' \quad [ \text{complementing both sides} ]$$

$$\begin{aligned} C &= m_0' m_1' m_2' m_4' && [ \text{DeMorgan's law} ] \\ &= M_0 M_1 M_2 M_4 && [ \text{from the previous page} ] \\ &= \Pi M(0,1,2,4) \end{aligned}$$

- The easy way is to replace minterms with maxterms, using the maxterm numbers that do not appear in the sum of minterms.

$$\begin{aligned} C &= \Sigma m(3,5,6,7) \\ &= \Pi M(0,1,2,4) \end{aligned}$$

- Example

$$\begin{aligned}
 F(A, B, C) &= AB + \bar{B}(\bar{A} + \bar{C}) = AB + \bar{A}\bar{B} + \bar{B}\bar{C} \\
 &= AB(C + \bar{C}) + \bar{A}\bar{B}(C + \bar{C}) + (A + \bar{A})\bar{B}\bar{C} \\
 &= \bar{A}\bar{B}\bar{C} + \bar{A}\bar{B}C + A\bar{B}\bar{C} + AB\bar{C} + ABC \\
 &= \sum m(0, 1, 4, 6, 7)
 \end{aligned}$$

| A | B | C | F     |
|---|---|---|-------|
| 0 | 0 | 0 | 1 ← 0 |
| 0 | 0 | 1 | 1 ← 1 |
| 0 | 1 | 0 | 0     |
| 0 | 1 | 1 | 0     |
| 1 | 0 | 0 | 1 ← 4 |
| 1 | 0 | 1 | 0     |
| 1 | 1 | 0 | 1 ← 6 |
| 1 | 1 | 1 | 1 ← 7 |

Minterms listed as  
1s in Truth Table

- **Canonical Form**
  - **Boolean Expression expressed in sum of minterms or product of maxterms**
- **Standard form**
$$F1 = y' + xy + x'yz'$$
- $F = (AB + CD)(A'B' + C'D')$
